
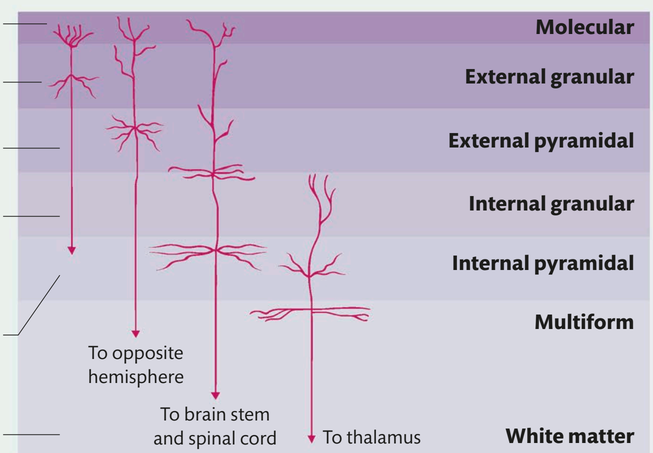
Brodmann areas
This functional map of the brain is based on research carried out by neuroanatomist Korbinian Brodmann, who linked cells by similarities in their size, shape, and connections. There are 52 regions in total, and each one can be associated with one or more approximate functions.

THE CORTEX CONTAINS AROUND **28 BILLION NEURONS**

Cell structure

The cells of the human cortex are arranged in six layers, with a total thickness of 0.09 in (2.5 mm). Each layer contains different types of cortical neurons that receive and send signals to other areas of the cortex and the rest of the brain. The constant relaying of data keeps all parts of the brain aware of what is going on elsewhere. Some of the more primitive parts of the human brain, such as the hippocampal fold, have only three layers.



CORTICAL LAYERS
