
Ocean in motion

Ocean waters are constantly moving. Their movements, called currents, are driven by wind and the Earth's spin. But ocean currents are also affected by the water's temperature and saltiness, as well as sea depth.

OCEANIC CONVEYOR

Surface currents and deep ocean currents link up to form a planet-wide conveyor belt flowing at times across the ocean basins, then rising to the surface, before sinking again to the deep ocean floor.

Warm **Cold**

IT CAN TAKE UP TO 1,000 YEARS FOR OCEAN CURRENTS TO
