

Rutherfordium

104
Rf

The artificial element Rutherfordium was named after New Zealand chemist Baron Ernest Rutherford, who studied and explained the structure of an atom. This element can be made by smashing together atoms of neon and plutonium.

Ernest Rutherford

Dubnium

105
Db

Element 105 was discovered by two independent teams in Russia and the USA. Dubnium was eventually named after the Russian city of Dubna, which is home to the Joint Institute for Nuclear Research (JINR), the centre of atomic research in the country.

ATOMIC MASS (268)

STATE Solid

DISCOVERY 1968 (team led by Georgy Flerov), 1970 (team led by Albert Ghiorso)

Seaborgium

106
Sg

This metal was named after the American chemist Glenn T Seaborg, who is credited with identifying and studying 10 artificial elements. Seaborgium is radioactive and its atoms break up after only a few minutes.
