Krypton

Forms

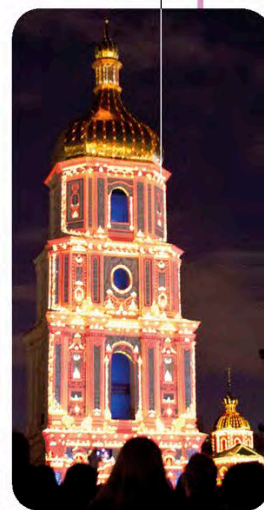

When this camera's flash activates, it's a result of krypton being electrified by the camera's battery.

Digital camera

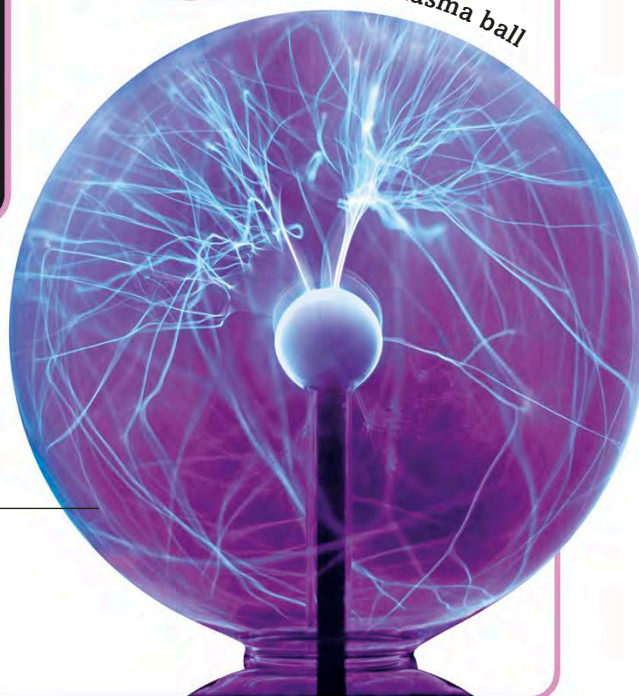

Sir William Ramsey won a **Nobel Prize** in Chemistry for discovering the noble gases.

Krypton-based lasers illuminate this building.

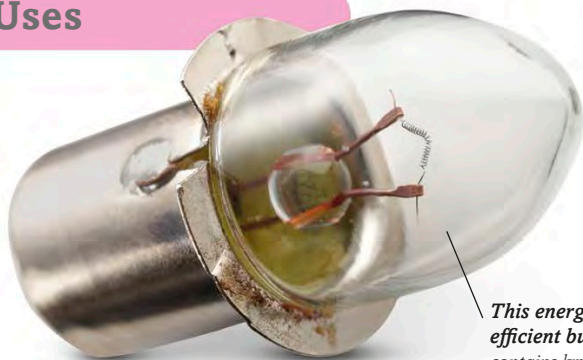

Laser lighting

Plasma ball

Uses

Incandescent bulb

This globe contains a mixture of noble gases, including krypton.

This energy-efficient bulb contains krypton.

The word **krypton** means the “hidden one” in **Greek**. This element exists as an inert gas in nature, which means that it does not react with almost any other element. Krypton is not found in any minerals and only tiny amounts of it can be found in the air. **Pure krypton** produces

a very bright white light when electrified with a current, which makes it ideal for use in **flash bulbs**. Krypton can react with the element fluorine to form the compound krypton fluoride, which is used to power some kinds of **laser**.
