Noble Gases

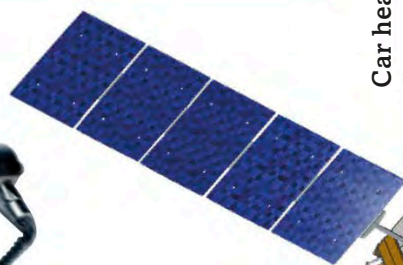

Forms

Uses

Modern film projector lamp

Electrified xenon blasts from the exhaust, pushing the probe forwards.

Car headlight

Xenon headlights glow brighter than the more common halogen headlights.

Xenon glow disinfects the air in a room.

Dawn space probe

Xenon is so rare that there is only one atom of this gaseous element for every 10 million atoms in the air. Like the other noble gases, xenon is colourless and odourless. It glows brightly when electrified, making it useful in very powerful lamps, such as those used in **film projectors** and

car headlights. The gas is harmless when breathed in and can be used as an **anaesthetic**. When preparing food, **xenon lamps** can purify the air. To propel spacecraft, xenon is used in some rocket engines that produce streams of fast-moving, electrified atoms.
