

The muddy water from volcanic springs contains radon.

Hot springs in Lisvori, Greece

These pipes draw water containing radon from deep under the ground, and this is then used to power the plant.

Geothermal power plant

This kit collects radon from the air so the amount of the gas in the area can be measured.

Oganesson

Yuri Oganessian

The heaviest element yet made is **oganesson**. Scientists think it would be solid at room temperature, but it may really be an unreactive, noble gas. However, only a few atoms have been created so far, so its properties are not well understood. Oganesson was first produced by a team of Russian and American scientists who smashed californium and calcium atoms together at the **Joint Institute for Nuclear Research** in Dubna, Russia. The element was named after **Yuri Oganessian**, the leader of the team.
