Titanium

Forms

Laboratory sample of pure titanium

Uses

The titanium plate placed inside acts as a shield.

This titanium joint can replace damaged bone in body.

Sunscreen

The titanium dioxide in this sunscreen blocks damaging ultraviolet (UV) radiation in sunlight.

Drill bit

This watch casing is made of a titanium alloy.

This drill bit is hardened with a coating of titanium nitride.

This titanium frame is lightweight but strong.

Named after the Titans, a race of mythic Greek gods, titanium is a silvery metal. It is as strong as steel but much lighter, and it is not corroded by water or chemicals. This strong metal also makes excellent protective shields in **body armour**. Titanium is commonly used

to prepare titanium dioxide, a compound of titanium and oxygen that is used in paints and **sunscreen**. Titanium is not toxic so it can be used to make medical implants, such as artificial **hip joints**. **Wristwatches** made with titanium alloys are light and strong.
