

NERVE PATHWAYS FOR SMELL AND TASTE

Both smell (olfactory) and taste (gustatory) sensations pass along cranial nerves directly to the brain. Smell signals travel from the olfactory bulbs along the olfactory nerve, which is made up of groups of nerve fibres, to a patch of the cortex located in the temporal lobe. Taste sensations travel along branches of the glossopharyngeal and facial nerves to the gustatory centre in the cortex.

NASAL CHAMBER

A 3-D CT scan shows the three shelves of bone known as the conchae on both sides of the nasal chamber.
