

RESPIRATORY

EXPLORED ON PAGES 160–175

The respiratory tract and its movements, powered by breathing muscles, carry air into and out of the lungs. Deep inside the lungs, gases are exchanged. On inhalation, life-giving oxygen is absorbed from air, while carbon dioxide waste is passed into the air, to be expelled from the body on exhalation. A secondary function of the respiratory system is vocalization.

SKIN, HAIR, AND NAILS

EXPLORED ON PAGES 176–189

The skin, hair, and nails form the body's outer protective covering, and are together termed the integumentary system. They repel hazards such as physical injury, microorganisms, and radiation. The skin also regulates body temperature through sweating and hair adjustment. A layer of fat under the skin acts as an insulator, an energy store, and a shock absorber.

LYMPH AND IMMUNITY

EXPLORED ON PAGES 190–209

The immune system's intricate interrelationships of physical, cellular, and chemical defences provide vital resistance to many threats, including infectious diseases and malfunctions of internal processes. The slowly circulating lymph fluid helps to distribute nutrients and collect waste. It also delivers immunity-providing white blood cells when needed.
