

Parietal bones

**A FLAT BONE
(PARIETAL)**

**AN IRREGULAR
BONE
(SPHENOID)**

BONE SHAPES

The shape of a bone indicates its function. Flat bones have large surface areas for the attachment of muscles; long bones work like levers; sesamoid bones are small and embedded within tendons.

**A LONG BONE
(FEMUR)**

**A SESAMOID
BONE
(PATELLA)**

**A SHORT BONE
(CALCANEUS)**

Metacarpals

Occipital bone

Cervical (neck) vertebrae

Acromion
Prominence (process) of scapula

Scapula
Shoulder blade

Coccyx
Tail of vertebral column

Femur
Thigh bone

Patella
Kneecap

Condyles
Rounded prominences that form a joint with another bone

Tibia
Shinbone

Fibula
Calf bone

Medial malleolus
Rounded prominence at end of tibia

Talus

Cuneiform bones

Cuboid bone

Lateral malleolus
Rounded prominence at end of fibula

Navicular

Tarsals
Ankle bones

Metatarsals

Phalanges

Talus

Calcaneus
Heel bone
