

NERVOUS SYSTEM

CONSTANTLY ALIVE WITH ELECTRICITY, THE EXTENSIVE AND COMPLEX NERVOUS SYSTEM IS THE BODY'S PRIME COMMUNICATION AND COORDINATION NETWORK.

The body's nervous system has three parts. The central nervous system, or CNS, is made up of the brain and spinal cord. The peripheral nervous system, or PNS, comprises 12 pairs of nerves from the brain and 31 pairs from the cord.

These branching nerves go to each part of the body, relaying information to and from the CNS, which has the roles of coordination and decision-making. The autonomic nervous system, or ANS, has nerve pathways in the CNS and PNS. Its work is primarily "automatic": it deals with activities such as heart rate adjustment and blood pressure control, of which we are rarely aware.

Spinal ganglion

One of many nodules that send sensory information to brain via spinal cord

Spinal cord

Part of central nervous system, extends from brain down the back, protected by vertebral column

Sympathetic ganglia chain

Part of sympathetic nervous system, also called paravertebral ganglia; conveys stress signals to body

Brain

Auriculotemporal nerve

Facial nerve

Axillary nerve

Phrenic nerve

Extends to diaphragm

Supraclavicular nerve

Brachial plexus

Vagus nerve

Lateral pectoral nerve

Deltoid nerve

Ulnar nerve

Musculo-cutaneous nerve

Intercostal nerves

Medial cutaneous branches of intercostal nerves

Dorsal branches of intercostal nerves

Subcostal nerve

Median nerve

Radial nerve

Ulnar nerve

Obturator nerve

Iliohypogastric nerve
