

your inner wrist: it should feel warm, but not hot. Cool the milk if necessary by placing the bottle in a pitcher of cold water, or running it under cold water while shaking the bottle all the time.

When the bottle is ready, hold your baby half sitting with her head in the crook of your elbow and her back along your forearm. Gently put the nipple into her mouth and tip the bottle so the milk covers the nipple to keep her from swallowing any air. Discard any formula leftover in the bottle and make a new bottle for each feed.

Bottle-feeding helps partners strengthen the bond with their baby and allows you to have some welcome time off from feeding.

LATCHING ON

Taking the time to ensure that your baby is latched on properly before a feeding is important because you could otherwise develop sore nipples. A baby that is properly latched on has their mouth wide open, with the whole areola (the area surrounding the nipple) in their mouth; their bottom lip will be curled back and they will be noticeably sucking. You'll feel a sucking effect over the entire area.
