

Causes UTIs are caused by bacteria entering the body through the urethra and multiplying. Such infections are probably more common during pregnancy due to hormonal changes.

What to do If you have any symptoms of a UTI, see your doctor right away. The doctor will take a midstream urine sample to identify the type of bacteria that is causing the infection. Your doctor may prescribe a seven to 10 day course of antibiotics that are safe for both you and your baby. Symptoms usually improve in a few days after the start of treatment. Because some UTIs are asymptomatic, you may be screened for this at 28 weeks..
