

A note on gender identities

DK recognizes all gender identities, and acknowledges that the sex someone was assigned at birth based on their sexual organs may not align with their own gender identity. People may self-identify as any gender or no gender (including, but not limited to, that of a cis or trans woman, of a cis or trans man, or of a non-binary person).

As gender language, and its use in our society, evolves, the scientific and medical communities continue to reassess their own phrasing. Most of the studies referred to in this book use “women” to describe people whose sex was assigned as female at birth, and “men” to describe people whose sex was assigned as male at birth.

A note on the artworks

The artworks depicting the adult body in this book use a blue-tinted, transparent illustration. Meanwhile, depictions of the fetus in the womb are visual representations of blood vessels as seen through translucent skin, and so these are pink-tinted. They have been designed to be as scientifically accurate as possible.

Once born, a baby’s skin tone changes gradually and can take up to six months to develop; this is determined by the rate of production of melanin.
