

appointments and ultrasound scans. You may be asked to limit activities like travel and exercise as your pregnancy progresses.

TESTS FOR DOWN SYNDROME

After 10 weeks of pregnancy, it is possible to have a test to assess the risk of your baby having a chromosomal abnormality, such as Down syndrome.

- **This can either be with a blood test and scan** between 10–14 weeks, or a blood test after 14 weeks.
- **A blood test**, known as the [noninvasive prenatal test \(NIPT\)](#) is available after 10 weeks.
- **If the results of any of these tests** show a high risk, a [diagnostic test](#) is offered.
