

For a calcium-packed snack, stock up on yogurt. Those that contain so-called friendly bacteria are okay to eat during pregnancy and may help your digestion. Choose plain varieties or those with the least amount of sugar. If you eat dairy-free yogurt, make sure it's fortified with calcium.

ASK A DOCTOR

I have diabetes. How will this affect my pregnancy? Whether you develop diabetes in pregnancy (known as gestational diabetes), or have preexisting diabetes, you will require special care from a diabetic health-care team and an obstetrician. This is because diabetes poses risks in pregnancy, particularly if there is poor control of blood-sugar levels.

Insulin requirements increase during pregnancy. You will be taught how to measure your blood sugar at home and the results will determine whether you require additional treatment for diabetes with oral medication or insulin injections.

Pregnant women who are diabetic are at a greater risk of high blood pressure, blood clots, and [preeclampsia](#). If you have diabetic kidney disease or diabetic retinopathy, a condition that affects the retina in the eye, there's a chance it will worsen during pregnancy. For your baby, there is an increased risk of congenital abnormalities and growth may be too fast or too slow.
