

As the pregnancy progresses, contact between your twin babies will increase. Because you'll have more ultrasound scans in a twin pregnancy, you'll have plenty of opportunities to see them interacting with each other.

ASK A DOCTOR

Can my baby feel anything when we have sex? The baby may be aware of some movements when you have sex and of a change in your heart rate, but they won't be harmed by either. You may find that your baby responds to these sensations by moving a lot while you're having sex, or just afterward. Some women find this inhibiting, but remember that it doesn't mean the baby is uncomfortable and, of course, they doesn't understand what you're doing! If you have an orgasm, your uterus will feel tight and you may have Braxton-Hicks contractions but, again, this is not harmful to your baby.

Be reassured that your baby is well protected by the pool of amniotic fluid. Also, the cervix is closed by a plug of mucus during pregnancy so no semen can enter the uterus; this helps to guard against infection.
