

The amniotic sac is sometimes referred to as a “bubble” because of its appearance. It may be transparent, but it's tough and extremely difficult to pierce, so your baby is very well protected in this safe environment.

ASK A DOCTOR

I fell recently. Could I have harmed my baby? Falling during pregnancy is extremely common, as your increasingly protruding abdomen, softening ligaments and joints, and changing center of gravity can cause you to lose your balance. The good news is that your baby is safely cocooned in amniotic fluid, which protects and cushions them when you fall. Your injuries would have to be quite severe to cause any harm to your baby.

The best thing you can do is to monitor your baby's movements after a fall. If they are normal all should be fine, but if you want reassurance, pay a visit to your doctor. If you do experience any discomfort, or unusual discharge or bleeding from your vagina, seek medical help. If you pass water, this is likely to be urine caused by stress incontinence (see [Ask a doctor](#)), not amniotic fluid.
