

YOU ARE **25 WEEKS AND 6 DAYS**

99 days to go

YOUR BABY TODAY

A 3-D scan can be colored in different ways. This image demonstrates that by this stage your baby's lip shape is clearly defined. The lips are the most sensitive part of the entire body and your baby's hands are often held up toward them.

“Your baby can make coordinated movements with their hands and feet, make a fist, and grab hold of their toes.”

Your baby's hand coordination dramatically improves now and they constantly brings their hands up to their face, particularly their mouth. The face, and especially the lips, are extremely sensitive, and this heightened sensitivity provides strong positive feedback as your baby successfully coordinates smooth, purposeful movements between hand (and foot) and mouth. There is still plenty of room in the uterus for all sorts of movements and your baby is extremely flexible. It is quite easy for them to adopt a doubled-up position, with their feet up by their mouth or even on top of their head, and do full somersaults.

Your baby's bones are hardening from the inside out—the outer edges are still formed of soft cartilage.

BIRTH WEIGHT

Weight gain during pregnancy influences the baby's birth weight. High birth weights have been associated with an increased chance of health problems in the baby's future. Thus, pregnancy is a balancing act, in which women need to take in just enough, but not too many, calories.

Health experts are concerned that fetal overnutrition is resulting in more babies being born with a high birth weight. This is thought to predispose the baby to an increased risk of poor health in childhood and beyond. Being overweight already, or putting on excessive amounts of weight during pregnancy, increases the chances of [gestational diabetes](#), needing a Cesarean delivery, or complications during the birth.

It is also important to try to return gradually to a healthy weight when you've stopped breastfeeding and before you try for another baby.

ASK A DOCTOR

Why do I get so hot when I'm exercising? During pregnancy, your core body temperature rises due to the effects of the hormone progesterone, your increased weight, and the greater demands on your body. Exercise generates heat and raises your core temperature even further.
