

My belly measurement has not changed in two visits. Why isn't my baby growing? In pregnancy, your abdomen is measured to establish the height of the top of the uterus, which indicates how the baby is growing. There is an element of subjectivity depending on the technique the doctor uses. In early pregnancy, measuring is not necessary because this doesn't give an indication of fetal growth, but after 26 weeks, growth can be assessed this way. However, the estimation of your baby's growth may still not be 100 percent accurate. If there are any concerns, your doctor may order an ultrasound.
