

High pressure at
start of heart
pumping cycle

Very low pressure
at end of heart
pumping cycle

An abnormal reading indicates that there is resistance to blood flow in the placenta, resulting in very little or no flow at the end of the cycle. The baby may not receive sufficient oxygen, which can affect growth.

QUESTIONS AND ANSWERS

I've heard about "kick counts." Should I be doing these? You may be advised to count how many times your baby moves over a period of time. However, it can cause undue worry to moms, and other indicators of movement, such as noting a change in the pattern of movement and inactivity when your baby is normally active, are important. Your doctor may ask you to note your baby's normal movement and contact them immediately if there are any changes in the pattern.

Can my baby move too much? Usually, the more movement, the better, even if this keeps you up at night or causes discomfort. An active fetus is not a sign that you'll have a restless baby or a hyperactive child.
