

YOU ARE **28 WEEKS EXACTLY**
84 days to go

YOUR BABY TODAY

The amniotic fluid is approaching its maximum amount at this time and your baby will have plenty of space in which to move. Here the baby is down toward the level of the umbilical cord. Your baby is still likely to change position several times a day.

“If you’re the first among your friends to have a baby, be prepared for friendships to evolve and change.”

Some friendships change as you go through different life stages. You’ll probably have had different groups of friends through school, college, and different jobs, with one or two close friends throughout. Friendships often develop with people when you’re at a similar stage in your lives. This means that during your pregnancy and when you have young children you may feel most comfortable with other women in similar situations. You’ll meet new friends at postpartum classes or post-partum groups, or in situations such as toddler swimming or music classes.

As you make new friends, you may find your old relationships begin to change. Friends without children may find it difficult to understand your new role as a mother, and the intense love that you have for your child, and you may start to drift apart. Of course this is not always the case; some friendships are unchanging, irrespective of whether your lives go along different paths.

CHOOSING ORGANIC

Opting to eat organic food is a personal choice, dictated by your beliefs and whether or not you can afford the higher price. Organic fruits and vegetables are grown with almost no pesticides, synthetic fertilizers, and herbicides. Organic meat, poultry, eggs, and dairy products come from animals that have high standards of animal welfare, without the routine use of antibiotics. For these reasons, organic foods should be lower in pesticide residues. However, all food in the US has to stay below pesticide residue tolerances.

Despite years of research, there is no consistent evidence from large-scale studies that organic food contains more nutrients than nonorganic foods. Some studies suggest that some fruits and vegetables may contain more antioxidant vitamins. This may be because organic vegetables contain less water, so the vitamins are more concentrated. One study found that organic milk provided more omega-3 fatty acids than nonorganic.
