

You are still feeling a lot of strong kicks, although the baby is moving around less.

The amniotic sac has finished growing and is no longer forming new cells. Because the membranes of the sac are highly elastic, they keep stretching as the baby gets bigger.

The tip of your baby's nose is still upturned and the bridge is becoming more evident.

In the brain, nerve cells are developing into distinct areas that will eventually control specific functions such as memory and coordinated movement. As yet, the neural network is very immature.

At 30 weeks the average crown to heel length is 15.7 in (39.9 cm) and the average weight is 2.9 lb (1.3 kg).
