

YOU ARE **30 WEEKS AND 1 DAY**

69 days to go

YOUR BABY TODAY

From this point in the pregnancy your baby will yawn just as often as during the first few weeks after birth. Exactly why babies yawn before birth remains unknown, but seeing your baby yawn on a scan is quite likely to make you yawn as well.

“It’s well worth giving some thought to where your baby is going to sleep before you actually bring them home from the hospital.”

It’s recommended that your baby sleeps in a crib in your bedroom for the first six months. See if you’re [considering co-sleeping](#). With your baby in your bedroom, you’ll be close by when they cry at night and able to attend to them easily. This is especially useful if you’re breastfeeding your baby.

Remember that babies are not necessarily quiet sleepers: they may wiggle, grunt, and move around and these noises may disturb you or your partner. If your partner has to go to work the following day, this extra disturbance may affect them. It will affect you, too, but you may have a chance to “catch up” on some sleep, or at least rest, when your baby naps. You should do what is best for your family, even if that means your partner spends some nights in the spare room. Some parents find that they are so exhausted by life with a newborn that they sleep, regardless of whether their baby is snuffling or not.

If the baby is in their own room you may worry that you may not hear them cry, but you will if you use a baby monitor. When they do cry, yet again at 3 a.m., be aware that a short trip along the landing can seem like a mile.

SHOULD YOU CO-SLEEP?

You may want to put your baby into your bed with you, and yet you may be concerned that you might roll over on them. For this reason, the American Academy of Pediatrics does not recommend co-sleeping. It can be especially dangerous if either of you smoke or use alcohol or drugs that make it hard to wake up, or if you sleep with the baby on a waterbed, couch, or in a chair. The safest place for your baby is in a bassinet near your bed.

BREAST CHANGES

In the third trimester, your breasts will begin to prepare themselves for feeding your baby, and you may experience some discomfort and changes that you had not anticipated. Your breasts will become fuller, and may actually feel very heavy; your areolas (the area around your nipples)
