

YOU ARE **33 WEEKS AND 2 DAYS**

47 days to go

YOUR BABY TODAY

Shadows give the impression of hair on the eyebrows and eyelashes on this 3-D image. Because this baby was lying head down, the view of the top part of the head is lost in the shadows caused by the mother's pelvis.

“With well-developed hearing, your baby may not be getting as much peace and quiet as they would like in the uterus.”

It is not quite as peaceful for your baby in the uterus as you might think. There will be a constant background noise produced by your heart beating, your breathing, and your stomach rumbling. While the uterus and amniotic fluid will prevent many quieter sounds from reaching your baby, voices do penetrate quite easily. Your baby has already learned to adapt to repetitive sounds but is now acquiring a memory for familiar noises. The most familiar sounds. Your baby will startle and turn toward loud or unfamiliar noises and these will also cause their heart rate to increase.

LIE AND PRESENTATION

Your baby's lie and presentation will be assessed by your doctor at every prenatal appointment. The “lie” refers to the position of the baby's spine in relation to the maternal spine. This can be longitudinal (vertical), transverse (horizontal), or oblique.. The “presentation” refers to which part of the baby is closest to the pelvis and would come out first during a vaginal delivery.

The most common presentation is head down, bottom up, called the cephalic presentation. Breech presentation (see below) is when the baby is bottom or feet down with the head upward. A footling breech means that the baby is head up or both feet are below the bottom. In an [anterior position](#), your baby's head is down and faces your back. In a posterior position, their head faces your belly, which can prolong labor and may increase the chances of an assisted birth.
