

awkward position, the procedure may not continue. If your baby is large, this can affect the procedure, as can the amount of amniotic fluid (a low amount offers less protection to the baby).

If you're Rh negative, you may get an Rh immunoglobulin (Rhlg) injection after the ECV due to the small risk of a bleed around the placenta. An ECV is not recommended if you have a multiple pregnancy, have had bleeding, your placenta is [low-lying](#), your membranes have ruptured, there is a known problem with the baby, or you should not have a vaginal delivery.
