

you. Discuss any concerns you have and why you don't want an induction. If you decide against an induction, you may need additional monitoring for the remainder of the pregnancy.

Many doctors induce labor by 41 or 42 weeks. If your pregnancy goes beyond 42 weeks and you don't want to be induced, your doctor may offer monitoring with scans to measure the baby's pulse and volume of fluid around the baby; or you may have an NST (see p.418) once or twice a week until labor to pick up any signs that the placenta is failing. If a problem is found, you'll be advised to have a Cesarean or an induction of labor.
