

DRONE DELIVERIES

Remote-controlled, pilotless aircraft, called drones, are designed for a wide range of purposes, including spying and warfare. Today, delivery companies are developing drones to carry items such as goods ordered online, medical supplies, and possibly even delivery meals. The drone shown here making a test flight is called the Parcelcopter. Produced in Germany, it is part of an ongoing research project started in 2013 on how to use drones to deliver consumer goods.
