

A PAYING AUDIENCE

The first public cinema screening shown to a paying audience was presented by the French brothers Auguste and Louis Lumière in Paris, France, in December 1895. They showed 10 short clips they had filmed.

LASER TECHNOLOGY

In the mid-1970s, movies moved into the home with the debut of video cassette players. The experience improved considerably with the first Hollywood studio-release DVDs in 1997, thanks to higher-quality picture and sound, more user-friendly menus, and sometimes interactive games.

SEEING IN 3-D

Experiments in 3-D film date back as far as the late 1890s, but the earliest 3-D film shown to a paying audience was *The Power of Love*, shown in Los Angeles in 1922.

This was also the first film to use anaglyph 3-D glasses that had lenses of opposite color. 3-D quality improved with the introduction of polarized lenses in 1986. The popularity of 3-D peaked with the most successful 3-D film, *Avatar*, released in 2009.

MODERN "FILM" CAMERA

The modern camera no longer uses reels of celluloid film; instead, it records using digital technology. The "films" are supplied to cinemas as digital files. The first digital screening was *Star Wars Episode I: The Phantom Menace*, in 1999.

Lens hood shields the camera lens from the glare of the Sun.
