

VACCINE DISCOVERY

In 1879, when Pasteur was researching a poultry disease called chicken cholera, he realized that weakened strains of a disease could be used to create a vaccine against the full-strength disease. This discovery helped him to develop vaccines against anthrax and rabies.

FIGHTING RABIES

Pasteur produced a vaccine for rabies (an infectious disease that affects humans and animals) in 1885. His first rabies patient was nine-year-old Joseph Meister, who had been bitten by an infected dog.

Pasteur became a national hero after the boy made a full recovery.

Louis Pasteur in his laboratory

1881

Pasteur creates a vaccine for the deadly disease anthrax, which he uses to successfully immunize animals, such as sheep, goats, and cows.

1885

He vaccinates a human for the first time, helping to cure a boy with rabies.

1887

He establishes the Pasteur Institute in Paris, which is dedicated to the research of infectious diseases.

1895

Pasteur suffers another stroke, but fails to recover this time. He dies on September 28, 1895.
