

◀ HAND PRESS

Gutenberg set up his press with metal type that could be arranged to print any page, and used a specially developed thick, sticky ink.

A solid wood framework held the press steady during printing.

Copperplate printing press

INTAGLIO PRINTING

In 15th-century Germany a new type of printing called intaglio was invented. This process uses images cut into a metal plate often made of copper or zinc and covered in ink. The plate is pressed into paper, creating sunken areas that hold the ink.

CHIAROSCURO WOODCUT

In this technique, invented in Germany around 1509, an image's outline is carved into a wood block, and then further blocks are carved with additional details. The blocks are pressed in turn onto paper, each block overprinting the image made by the one before. The result is a picture with contrasting areas of light and shape that make an image look three-dimensional. *Chiaroscuro* is an Italian word meaning "light-dark".

Chiaroscuro print of a ceiling design with three angels

When the image is printed, it appears in reverse on the paper.

Lithography printing in a workshop

LITHOGRAPHY

Invented by the German Alois Senefelder in the 1790s, lithography is based on the fact that oil and water do not mix. A greasy substance is used to draw an image onto limestone, which is then dampened with water. When ink is spread on the stone it sticks only to the grease, and the image is pressed onto paper.
