

The liver

The liver is the body's largest internal organ, and all of our blood flows through it. The liver cells remove and add substances to help clean the blood. This helps to keep conditions stable inside the body.

Blood supply

The liver receives 80 percent of its blood from the hepatic portal vein. Veins carry the blood from the digestive organs to the hepatic portal vein, which then enters the liver. This blood is rich in nutrients, which the liver processes in its cells.

Liver

The gall bladder
stores bile

Liver cells perform over 500 functions, including storing nutrients and removing poisons from blood. They also make bile, which is used to help digest fats.

Large intestine

The **small intestine** is where most nutrients are absorbed into the bloodstream
