

Female reproductive system

The female sex organs are made up of the two ovaries and fallopian tubes, the uterus, and the vagina. An egg is released from one of the ovaries every month. If the egg is fertilized by a sperm, it will travel to the uterus, or womb, and develop into a baby.

An **egg, or ovum**, is the body's widest cell—0.004 in (0.1 mm) across, which is 50 times wider than the head of a sperm.
