

Fallopian tube
carries the egg
toward
the uterus

**Lining of
the uterus**

The uterus has a
thick, **muscular
wall** that will
protect the baby

Around **3–4 days** after
fertilization, a ball
of 16-32 cells has
formed. This will soon
enter the uterus from
the fallopian tube.

Around **6 days** after fertilization,
the ball of cells burrows into the
uterus lining and begins to
develop into a baby.
