

Finger pullers

The muscles that move the fingers are found mostly in the forearm. They are attached to the finger bones by long tendons that cross the wrist. Forearm muscles on the same side as the palm bend the fingers, while those on the same side as the back of the hand straighten the fingers.

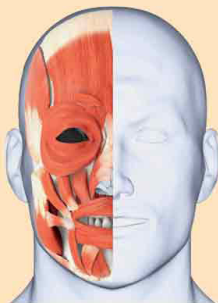

Straightening the elbow

Biceps relaxes
and gets longer

Triceps contracts
and pulls the forearm
downward

FACE SHAPERS

Facial expressions are created by more than 30 small muscles that pull the skin.

Muscles pull the corners of the mouth upward and outward and lift the top lip when a person **smiles**.

If a person is **sad**, the corners of the mouth are pulled downward and the eyebrows are wrinkled.
