

Creepers and climbers

Fine tendrils twirl slowly around until they find something to grab onto.

Vines **recognize** their own chemical **signal** so avoid strangling themselves.

Star jasmine

This sweetly scented climber is covered in white flowers.

Gardeners often grow these fragrant flowers up a teepee of poles.

Everlasting pea

Showers of flowers hang from twining stems.

The plant's thorny stems can grow up to 39 ft (12 m) tall.

Bougainvillea

Wisteria

Thorny hooks

Vines can be creepers or climbers. Creepers grow and spread along the ground, while climbers clamber up towards the sunlight. As these vines grow, they may curl around a tree, or up a wall or fence, adding colour to the garden.

Some creepers, such as **jasmine**, twirl their flexible stems around other plants to reach for the sky. **Clematis** plants do the same but use long leaf stalks to wrap around their neighbors in order to climb upward. **Bougainvillea** hooks its thorns into surfaces to drag itself higher, while **everlasting pea**,
