

Blackberry

Juicy berries are eaten by harvest mice, which pass the seeds in their poo.

Dandelion

Scattering seeds

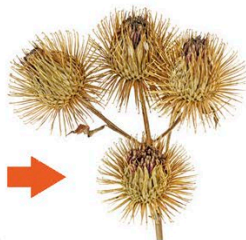

When shaken, lotus seeds fall from the dried seed pod and into the lake or pond in which the plant grows.

Lotus

Spiky burdock seeds can grow up to 1 in (3 cm) across.

Burdock

Between 90 and 110 feathery bristles radiate outward to form a parachute on every seed.

Plants are anchored by roots and can't move from one place to another. If they dropped their seeds where they stood, the new plants would be in competition for nutrients and sunlight. So plants have developed many ways to make sure their seeds scatter far and wide to take advantage of new places in which to grow. They use exploding seed pods, animals, the wind, or even water to spread their seeds.
