

Honey locust

Veins from the main leaf stalk run through each leaflet.

Divided into an odd number of leaflets

Four heart-shaped leaflets grow from a single stalk.

Four-leafed pink sorrel

Four leaflets

Flat leaf stalk looks like a second leaf below the true leaf.

Five leaflets

Horse chestnut

Pomelo

Leaf stalk (bottom) looks like true leaf

Silver fern

Silvery undersides of the leaves give this fern its name.

White clover

Three leaflets

A whitish, V-shaped band is typical in white clover leaflets.

Divided twice

LONGEST LEAF

Raffia palm leaves grow a whopping 82 ft (25 m) long—more than twice as long as a school bus.

82 ft (25 m) long

Raffia palm leaf

making them less likely to break off. Having compound leaves can also help the plants avoid being eaten. Leaflets of the **sensitive plant** quickly fold up if touched by hungry animals, while **tamarind** leaflets close up at night to appear smaller and less tasty to plant eaters.

Some compound leaves grow very quickly, which helps trees, such as the **honey locust**, harness as much sunlight as possible before losing their leaves in the fall. The **pomelo** has a rare type of compound leaf with a flat stalk that looks like a second leaf, which also helps capture sunlight.
