

European silver fir

Young silver fir trees are often used as Christmas trees in Europe.

Blue spruce

Sharply pointed needles

This slow-growing but resilient tree has a life span of 150–600 years.

Needles grow in bunches of five and can be 4 in (11 cm) long.

Tamarack larch

Short needles turn golden yellow and orange in fall.

This wide-spreading tree can reach up to 130 ft (40 m) in height. It is the national emblem of Lebanon and appears on its flag.

Lebanon cedar

Whorls of needles

Sitka spruce

This tall tree can grow rapidly, reaching more than 310 ft (95 m) in height.

Sugar pine

shorter than pine needles. Firs, such as the **European silver fir**, have flat needles that grow individually from the branch. Spruces, including the **blue spruce** and the **sitka spruce**, have sharp four-sided needles. Larch needles are particularly unusual because,

unlike most conifers, they are not evergreen but deciduous. In fall, the light blue-green needles of the **tamarack larch** change color before falling off, turning the wooded mountains glorious golden colors.
