

Sugar pine (wet)

Scales open in dry conditions to release winged seeds up to 1½ in (4 cm) long.

Sugar pine (dry)

The pink female cones of this spruce are 6 in (15 cm) tall and the largest of the spruces.

Norway spruce (female)

Green cones produce bright orange seeds.

Pineapple zamia

These blue female cones stand upright on top of branches.

Korean fir

Colorful pollen cones are only ¼ in (2 cm) long.

Pitch pine (male)

Atlas cedar (male)

This soft-scaled cone grows up to 3 in (8 cm) long.

The female cones of the **kauri** break apart and release seeds when mature, while **lodgepole pine** cones do not open until they feel the strong heat of a fire. The female cones of the **sugar pine** open only in dry weather, so their light seeds are blown far and wide without moisture in the air weighing them down.

CONE SIZE

The sugar pine grows the world's longest conifer cones—more than four times longer than a human hand.
