

Anther

Pollen sticks to the hairs of visiting bees.

Some bees collect balls of pollen on their hind legs and transport it back to the hive for food.

The style is the stalk that supports the stigma.

Nectar > Many flowers produce a sweet liquid called nectar at the base of the petals to attract pollinators such as bees.

Ovule

A stalk supports the flower.

Tiger lily

Ovary > This part of the flower contains female sex cells, which are fertilized by the pollen. After fertilization, the ovary develops into a fruit, with the seeds inside.
