

Crazy for daisies

With nearly 25,000 species, daisies make up one of the largest plant families. But their pretty flower heads are not quite what they seem. What looks like one flower is in fact a cluster of lots—sometimes thousands—of tiny flowers in the center, with a ring of what looks like petals but is in fact more flowers around the edge.

Coneflower

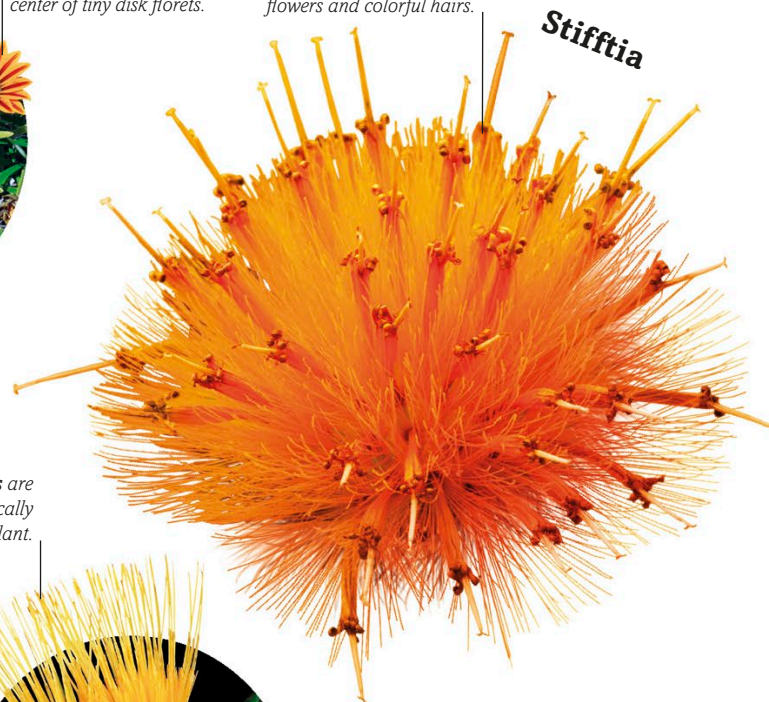

Pink petals surround a spiny conelike center that is full of nectar.

Treasure flower

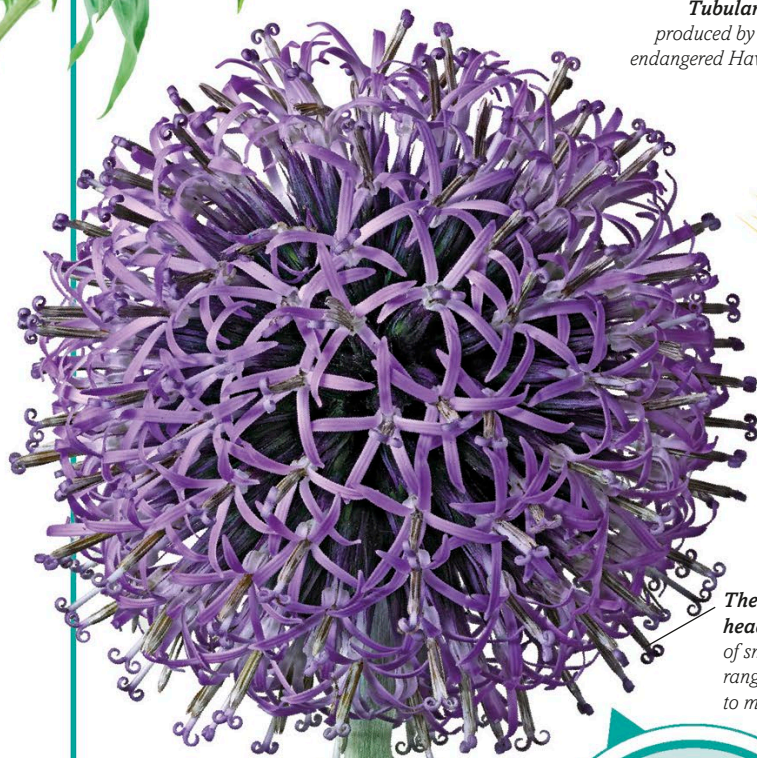

The striped ray florets surround a center of tiny disk florets.

Orange pom-poms are made of individual flowers and colorful hairs.

Stiffia

Tubular flowers are produced by this critically endangered Hawaiian plant.

Globe thistle

The spiky **globe thistle** is also called the **blue hedgehog**.

The round flower head is made up of small flowers, ranging from purple to metallic-blue.

Maui island-aster

Yellow-tipped red florets, which look like flames, give this plant the name "firewheel."

Blanket flower

Three separate florets look like a single flower.
