

Khufu's son Khafre built his pyramid on higher ground than his father's, so it appears to be taller than it is.

The Great Sphinx is 66 ft (20 m) tall, with a human head on the body of a lion.

The Great Pyramid of Khufu is the tallest of the three pyramids at Giza. The smallest pyramid (not shown) is that of Menkaure, which was also the last to be built here.

Revealing the tombs

Archaeologists have been working at Giza for over two hundred years. Today, parts of the site that were once covered by sand have been excavated. It is possible to walk through temple ruins, enter tombs, and follow narrow passageways to the burial chambers inside the pyramids. New artifacts and even tombs are still being found in the area.

Digging at Giza

Excavation work is still ongoing at Giza. Archaeologists today work to find out more about the people who built the pyramids, as well as the pharaohs buried inside.

THE AFTERLIFE

Ancient Egyptians believed that life continued after death. Here, the god Anubis weighs the heart of a dead person against a feather to decide if they are evil or good enough to go on to the afterlife.
