

An aerial photograph of the Great Pyramid of Giza, showing its massive scale and the surrounding desert landscape. The pyramid's surface is composed of numerous smaller stones, and its edges are sharp and well-defined. The surrounding area is flat and arid, with some small structures and a winding road visible in the distance.

The Great Pyramid of Giza was built in the 26th century BCE as a tomb for the king, Khufu. The largest of the pyramids at Giza, with an original height of 146.5m (481 ft), it represents the peak of the Egyptian art of pyramid-building, and is the oldest of the Seven Wonders of the Ancient World.
