

Uses

Tennis racket

This aluminium frame makes the racket light.

This foil does not break even as it is bent and twisted.

Aluminium foil

This suit protects against temperatures up to 1,000°C (1,800°F).

Fire protection suit

Aluminium can

This can is produced from recycled aluminium.

Recycling
one aluminium can
saves enough energy
to run a TV for
three hours.

Aluminium cables are lightweight.

Overhead cables

RECYCLING ALUMINIUM

Aluminium is expensive to purify, so it is often recycled instead. Drinks cans are almost 100 per cent pure aluminium and can be shredded, melted down, and made into new cans.

Smartwatch

The aluminium casing protects the touchscreen.

Parts of this dome are made of aluminium.

Esplanade Theatre, Singapore

This plane's fuselage is built from sheets of aluminium stretched around a frame.

Boeing 737

this foil reflects away heat. Aluminium is the most widely used metal after iron. It is very lightweight compared to iron's alloy steel and almost as strong. A dome made from aluminium, such as the one in the **Esplanade Theatre** in Singapore, can be much larger than

a steel-based one, which would collapse under its own weight. Aluminium is also a good electrical conductor and so is used in **overhead cables**. Tough aluminium alloys are used to produce parts of some aircraft, including the **Boeing 737**.
