Nitrogen

Forms

Microscopic image of root nodule

This is a naturally occurring form of sodium nitrate.

Bacteria living inside plant roots can take nitrogen from the air for use by the plant.

Liquid nitrogen

This clear and colourless liquid forms when nitrogen is cooled to below -195°C (-319°F).

Saturn's largest moon has an atmosphere containing 48% nitrogen.

Titan

Nitrogen surrounds us all the time because it is the transparent gas that makes up nearly three-quarters of Earth's atmosphere. Since **pure nitrogen** does not react easily, its **liquid form** can be used to freeze and preserve items such as blood and tissue samples.

Nitratine is one of the few minerals rich in nitrogen. Some useful nitrogen compounds can be made by industrial processes. A group of nitrogen compounds is used in explosives, including **TNT** and **nitroglycerine**. When ignited, they explode because the bonds
