

1 H Hydrogen

Forms

This gaseous stellar nursery is giving birth to thousands of stars.

The Sun is four-fifths hydrogen.

Three quarters of this planet is made up of layers of gaseous and liquid hydrogen.

Water

Each water molecule has two atoms of hydrogen and one of oxygen.

Hydrogen is the first member of the periodic table because it has the simplest atoms of all elements: they contain just one proton and one electron. Pure hydrogen is a transparent gas. The biggest planets, such as **Jupiter**, are vast balls of hydrogen mixed with

other gases, such as helium and methane. On Earth, hydrogen is commonly found in **water**. Although it is rare in Earth's atmosphere, hydrogen is the most common element in the Universe. Stars, such as the **Sun**, contain large amounts of hydrogen. At the centre of a star, atoms of
