

types of bones

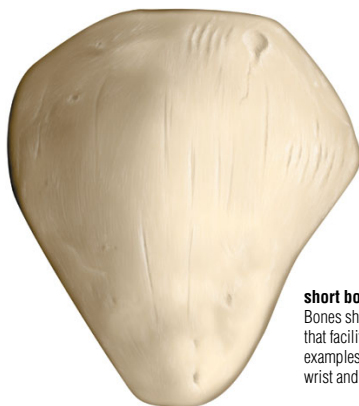

Bones: rigid structures connected by joints to which muscles are attached. The skeleton has more than 200 bones divided into four major groups.

**flat bone**

Thin bones that protect certain organs, including most of the bones of the skull as well as the scapula.

**long bone**

Elongated bone to which powerful muscles, such as those of the leg and arm, are attached.

**short bone**

Bones shaped somewhat like cubes that facilitate flexibility of the joints; examples include the bones of the wrist and ankle.

irregular bone
Bones of varying shapes and sizes, such as the vertebrae and certain bones of the skull or pelvis.
