

TUSK SHELLS

These seashells are not often found on the beach. Most of them live buried beneath the sand in deep water.

CHITONS

The shells of chitons are made of eight movable, overlapping sections. They are sometimes called coat-of-mail shells. Chitons live under rocks and stones near the shore.

CHAMBERED SHELLS

A few shells are divided inside into chambers. In the squid-like Nautilus, some chambers are gas-filled, which allows the shell to float. The chambered shell of the Spirula squid is inside the animal, not outside. The similar-looking Paper-nautilus "shell" is the empty egg case of an animal called an argonaut.
