

SPREADING SEEDS

Fruit seeds are spread in a number of ways. They can be blown by the wind, carried by water, or dropped when a fruit falls from a plant or tree. Often, seeds are spread by birds.

3 NEW TREE GROWS

The seed germinates in the ground and begins to form a new plant or tree.

1 BIRD EATS FRUIT

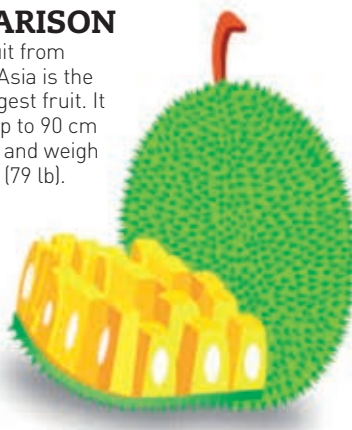

Birds love to eat the bright fruits that hold the seeds.

2 BIRD PASSES SEED OUT

Once the bird has digested the fruit, it excretes the seed that was inside the fruit.

SIZE COMPARISON

The jackfruit from Southeast Asia is the world's largest fruit. It can grow up to 90 cm (35 in) long and weigh up to 36 kg (79 lb).

JACKFRUIT

STINKIEST FRUIT

Many people consider the world's stinkiest fruit to be the durian. It can smell like rotten onions, but has a sweet, custard-like flesh.

DURIAN

COCONUT

NECTARINE

LYCHEE

RAMBUTAN

PEACH

BLACKBERRY

RASPBERRY

DAMSON

PLUM

APRICOT

ACCESSORY FRUIT

Some kinds of fruit grow differently from others. They are known as accessory fruit. The core fruit group is sometimes included within this category.

STRAWBERRY

STRAWBERRIES ARE PART OF THE ROSE FAMILY OF FLOWERING PLANTS

PINEAPPLE

BREADFRUIT

FIG

CORE FRUIT

These fleshy fruits have thin, often edible, skins. Their seeds are contained in the core at the centre of the fruit.

LOQUAT

APPLE

PEAR

QUINCE

MELONS BELONG TO THE SAME PLANT FAMILY AS THE CUCUMBER AND HAVE BEEN GROWN SINCE ROMAN TIMES

MELONS

The melon originated in Africa. Each melon contains many seeds in the centre, which are surrounded by soft, sweet, juicy flesh. The hard skin is inedible.

CANARY MELON

CANTALOUPE

CRENSHAW MELON

HONEYDEW MELON
